1. **In a multiple variable regression, the F-test helps us determine whether the explanatory variables are jointly significant.** 1 / 1 point

   For this, we examine the P-value of the F-test.

   The explanatory variables are jointly significant, (that is, they work together in a statistically significant way to influence the dependent variable) if:

   - ○ The P-value of the F-test < 2
   - ○ The P-value of the F-test > 2
   - ○ The P-value of the F-test > 0.05
   - ◉ The P-value of the F-test < 0.05

   ✓ Nice work

   Yes, this is correct.

2. **In a multiple variable regression, the difference between the t-Stat and the F-Stat is that:** 1 / 1 point

   - ○ The t-Stat is more accurate, whereas the F-stat is less accurate.
   - ◉ The t-Stat helps us determine the individual significance of each explanatory variable, whereas the F-stat helps us determine the joint significance of all explanatory variables.
   - ○ The t-Stat is less accurate, whereas the F-stat is more accurate.
